

IN THE CLAIMS

Please cancel Claims 14, 18-20, 22, 24, 26 and 28, without prejudice or disclaimer of subject matter, and please add Claims 29-37. The following is a complete listing of claims and replaces all prior versions and listings of claims in the present application:

Claims 1-28 (canceled)

Claim 29 (new): An information provider system comprising:

F/ a database on a network, for storing content information corresponding to an identification code;

a client communication terminal comprising an extraction unit for extracting an identification code from data and a transmission unit for transmitting the extracted identification code to a server terminal;

an acquisition unit for acquiring content information corresponding to the transmitted identification code from said database; and

an output unit, connected to the server terminal locally, for outputting the acquired content information.

Claim 30 (new): The system according to claim 29, wherein said client communication terminal further comprises an indication unit comprised of a single physical key for extracting an identification code and for transmitting the identification code to the server terminal.

Claim 31 (new): The system according to claim 29, wherein the data is mail data in which the identification code is described.

Claim 32 (new): The system according to claim 29, wherein said extraction unit extracts the identification code for a plurality of the data at once.

FI Claim 33 (new): The system according to claim 29, wherein the data is mail data in which the identification code is described, wherein said client communication terminal further comprises a display unit for displaying the mail data, and wherein the identification code is displayed by another form which is different from character strings excluding the identification code in the mail data.

Claim 34 (new): The system according to claim 29, wherein said client communication terminal further comprises:

a storage unit arranged to store the extracted identification code in a memory;

and

a selection unit adapted to, after the identification code is transmitted by said transmission unit, select whether or not the identification code stored in the memory is erased.

Claim 35 (new): A communication method for use with a communication apparatus for requesting for outputting content information stored in a database on a network, said method comprising the steps of:

extracting an identification code from data including the identification code;
and
transmitting the extracted identification code to a server terminal,
wherein content information corresponding to the transmitted identification
code is output from an output unit connected to the server terminal locally.

FI
Claim 36 (new): A program product for causing a set of one or more computers
to perform communication method for requesting for outputting content information stored in a
database on a network, said method comprising the steps of:

extracting an identification code from data including the identification code;
and
transmitting the extracted identification code to a server terminal,
wherein content information corresponding to the transmitted identification
code is output from an output unit connected to the server terminal locally.

Claim 37 (new): A computer-readable memory medium storing executable
code for causing a set of one or more computers to perform communication method for
requesting for outputting content information stored in a database on a network, said method
comprising the steps of:

extracting an identification code from data including the identification code;
and

transmitting the extracted identification code to a server terminal,

F/

wherein content information corresponding to the transmitted identification

code is output from an output unit connected to the server terminal locally.
